1.0 SUMMARY

Alpine Geophysics (Alpine) adapted an EPA developed nationwide one-atmosphere photochemical grid modeling database to assess the impact of PM precursor emissions from identified source regions and categories on downwind monitor locations.

This project employed the latest modeling technology, consistent with EPA's source apportionment and design value analysis tools. Source impacts from a set of source region and group combinations and report relative PM_{2.5} impact were estimated from each of these combinations.

Alpine performed two different sets of particulate source apportionment (PSAT) modeling. One set (*source-region*) was designed to examine the impact of nearby regions on urban core non-attainment monitors in seven (7) urban regions. The other set (*source-sector*) was to examine the relative importance of emission sources for thirty-nine (39) source groupings across the continental United States, lower 48 state modeling region. Both simulations tracked sulfate, nitrate, and direct PM sources aimed at addressing precursor impacts on PM_{2.5}.

Initial observations indicate that for most analyzed monitors projected to be above 9.0 µg/m³ in the 2026 base case, local contributions (sources in the analyzed region closest to, possibly containing, the monitor) tend to drive annual modeled PM_{2.5} concentrations. In urban area locations, anthropogenic emissions from commercial cooking, residential wood combustion, and waste disposal have the highest percentage of modeled PM_{2.5} concentrations. At monitors near international borders, total traced species from boundary conditions and Canadian and Mexican anthropogenic categories dominate the modeled contribution to the overall annual PM_{2.5}. Finally, at remote mountain monitors, wildfire, boundary conditions, prescribed fires, and residential wood combustion dominate the contribution to the total annual PM_{2.5} concentrations.

2.0 INTRODUCTION

Alpine Geophysics, LLC was contracted by the American Petroleum Institute (API) and the Midwest Ozone Group (MOG) to configure and conduct an analysis designed to support a review of PM_{2.5} issues in the United States.

This project included Particulate Source Apportionment Technology (PSAT) simulations using the Environmental Protection Agency's (EPA) version 3 of the 2016-based air quality modeling platform and modeling configuration (EPA, 2023a, 2023b) to provide the foundational model-input data sets for 2026 base case projection year modeling and reporting of the results relative to the contribution of tagged sources on downwind monitor modeled PM_{2.5} concentrations and annual design values. At the time of this analysis, projections of PM NAAQS attainment year 2032 had not been developed using a current modeling platform and so 2026 was considered to closely approximate emissions distributions for 2032.

Source apportionment within the CAMx photochemical grid model is often used to estimate source impacts on secondary pollutants. Source apportionment can be used for tracking particulate matter species using the PSAT technique. Source apportionment uses instrumented modeling that employs tracers to apportion the total modeled concentrations among various sources, both direct (e.g., via boundary conditions) and secondary (e.g., via chemistry). Apportionment differs from sensitivity in that apportionment estimates a unique source attribution within the single chemical environment that results from the interaction of the source in question with all other contributors, whereas sensitivity estimates a range of chemical environments in response to changes to the source in question and its interactions with all other contributors. The use of source apportionment does not perturb the chemical environment in the model as can occur with sensitivity or "zero out" modeling.

In this study, source impacts from a set of predefined source and region groups were estimated and relative PM_{2.5} impact from each of these groups is reported.

3.0 MODELING APPROACH

The Particulate Source Apportionment Technology (PSAT) modeling was performed using 2026 projection year data from EPA's 2016v3 modeling platform (EPA, 2023a, 2023b). This platform was developed to support individual state implementation plan (SIP) development and used by EPA for the air quality modeling of the Final Rule for the 2015 Ozone NAAQS Good Neighbor Plan. It includes meteorology, initial and boundary condition concentrations (the concentrations of pollutants at the edges of the largest modeling domain) and other inputs representative of the 2016 base year and 2026 projection year used in this analysis.

EPA developed the emission inventories for projection year 2026 using methods that are specific to the type of emissions source (EPA, 2023a). Future year emissions are projected from 2016 base case either by running models to estimate emissions from specific types of emission sources (e.g., EGUs, and mobile sources), or for other types of sources by adjusting the base year emissions according to the best estimate of changes expected to occur in the intervening years (e.g., non-EGU point and nonpoint sources). For biogenic, all fire, and fertilizer sectors, the same emissions are used in the base and future year, as emissions for these sectors are highly correlated with meteorological conditions.

The photochemical grid model comprised the Comprehensive Air quality Model with extensions (CAMx v7.10) (Ramboll, 2021). Meteorology and initial/boundary conditions were taken from the EPA 2016 12 km continental US (CONUS) CAMx modeling platform. Additionally, this study defined a specific set of source and region categories (source tag) defined to support the source apportionment modeling, as described below.

Alpine conducted modeling using PSAT, the CAMx source apportionment tool for PM to separately track sulfate, nitrate, and direct PM impacts on PM_{2.5}, from each of the region/category combinations. The results of these PSAT simulations were then processed using EPA's Software for the Modeled Attainment Test - Community Edition (SMAT-CE) version 2.1 (EPA, 2022) to calculate the impact on downwind monitor future design values from the individual source tags.

3.1 PSAT Source Apportionment

To gain a better understanding of the source contributions to modeled PM_{2.5} concentrations, Alpine used CAMx PSAT modeling. PSAT uses multiple tracer families to track the fate of both primary and secondary PM. PSAT is designed to apportion the following classes of CAMx PM species:

- Sulfate (PSO4)
- Particulate nitrate (PNO3)
- Ammonium (PNH4)
- Secondary organic aerosol (SOA)
- Primary PM (PEC, POA, FCRS, FPRM, CCRS, and CPRM), and
- Particulate mercury (HgP)

For this application, sulfate, nitrate, ammonium, and primary PM were tracked using PSAT. Tracking of SOA contributions may also be of use, but SOA tagging in PSAT adds significant time to the model runs and if used with the other tracked species exceeds the capabilities of the available computing systems. Therefore, SOA was not explicitly tracked.

PSAT allows emissions to be tracked (tagged) by various combinations of sectors and geographic areas (e.g., by state or county). For this application, the 2026 emissions were tagged by a combination of source categories and regions. The sections below show the source and region sector tags that were modeled in 2026 using the CAMx PSAT. Each of these combinations were processed separately through the SMOKE (CMAS, 2017) emissions modeling system and tracked in PSAT as individual source tags.

3.2 Source Specification

For the *source-region* run the model was run with two (2) source groups; 1) “natural” emissions consisting of fires, lightning NO_x, biogenics and sea salt; and 2) anthropogenic sources.

For the *source-sector* run the thirty-nine (39) individual emission groups represented in Table 1 were modeled.

Table 1. Emission source specification.

Note that each “source” comprises a set of emission categories from several processes as defined from sources in the EPA modeling platform. A list of SCCs associated with each tag is provided in Appendix A.

3.3 Region Specification

For the *source-sector* PSAT run, a single source region was used to allow for a greater number of source sector groups.

In the *source-region* run, designed with the intention to determine the contribution of anthropogenic emission sources with respect to their relative distance to the monitor, seven representative source region groups were configured in a PSAT run using a variety of centralized, monitor-based locations and extending regions. The source regions use one of the following configurations:

1. Grid cell based (3x3, 9x9, 15x15, 21x21 grid cells)
2. County based (county with monitor is center with adjacent counties as first ring and next adjacent as second ring)
3. Nonattainment area based (counties identified in ozone NAA are center with adjacent counties as first ring and next adjacent as second ring)

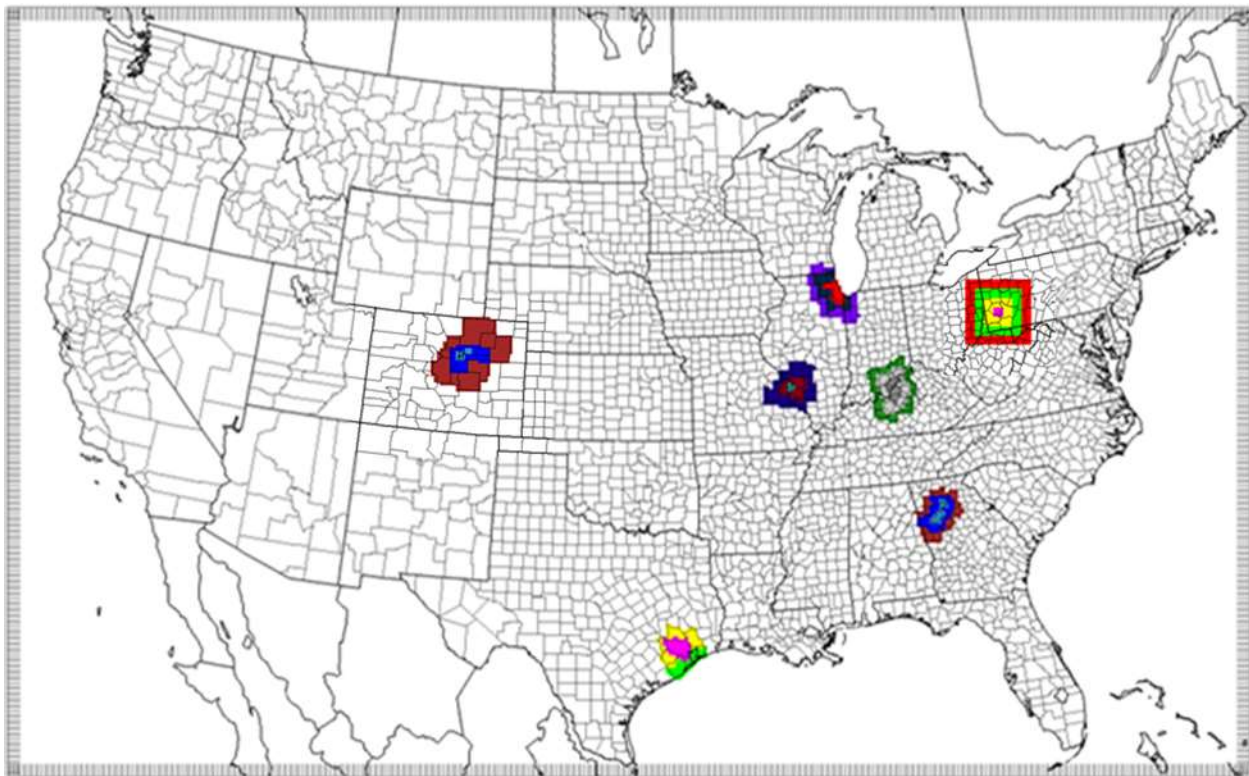

Figure 1. Source region representation for PSAT run.

For the *source-region* simulation, the model was run with twenty-three source regions grouped into seven domains. For Atlanta, Chicago, Denver, Houston, St. Louis, and Louisville the regions consisting of a “core” region covering the city center and two surrounding regions to represent counties of bordering the “core” or the counties adjacent those counties. For Pittsburgh, a grid-based definition was used with a 3x3 12km grid cell region over metro Pittsburgh with three rings of 9x9, 15x15 and 21x21 12km grid cells. The final source region contained all grid cells not contained in another region. The source regions are detailed in Figure 2 through Figure 4.

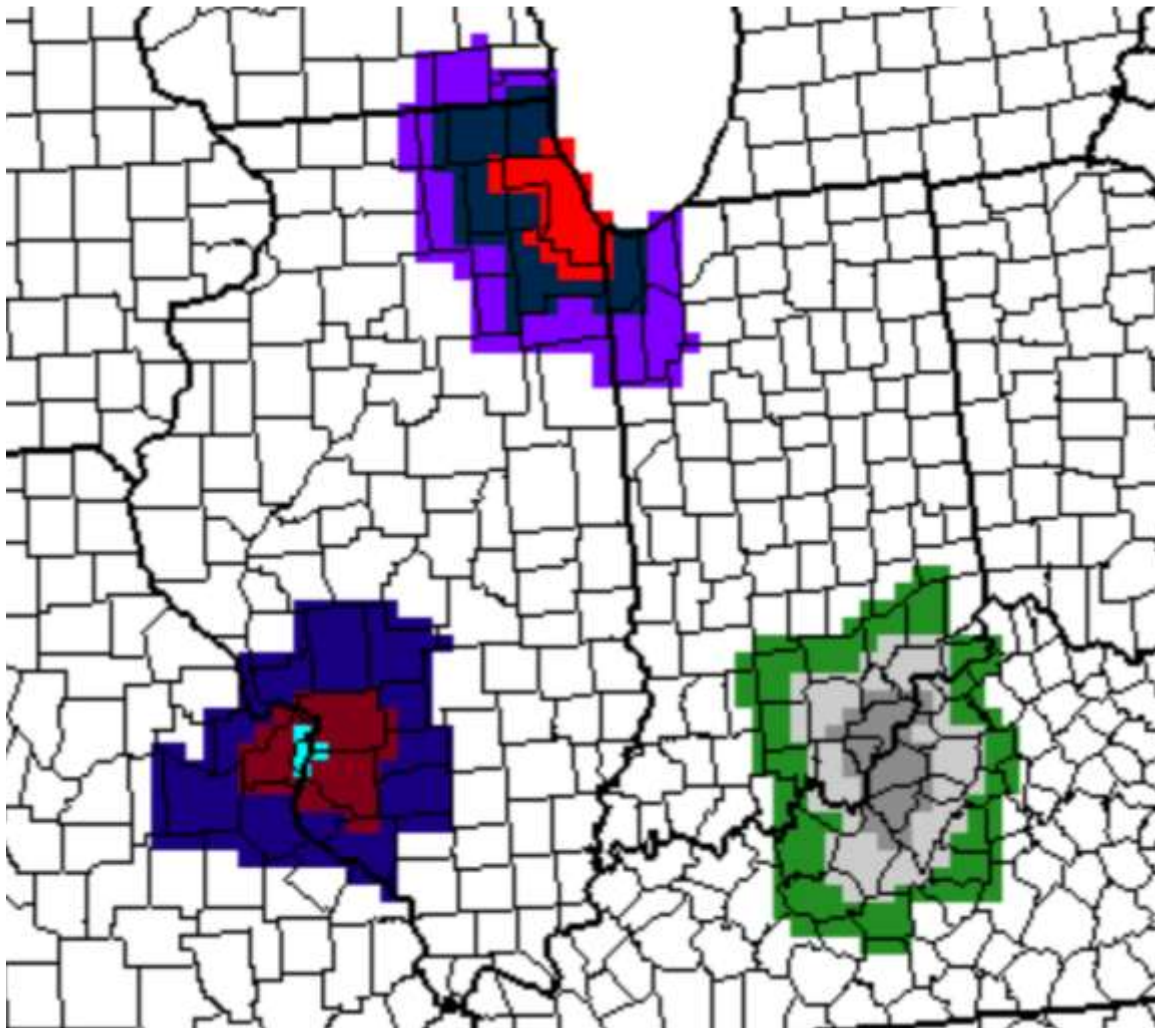

Figure 2. Source region representation for Chicago, St. Louis and Louisville.

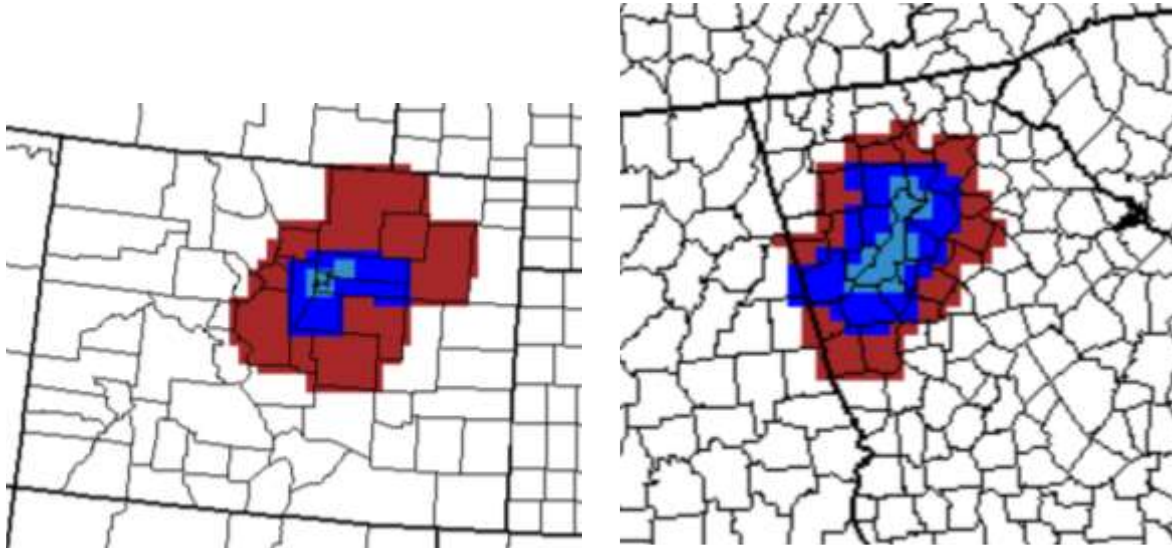

Figure 3. Source region representation for Denver (left) and Atlanta (right).

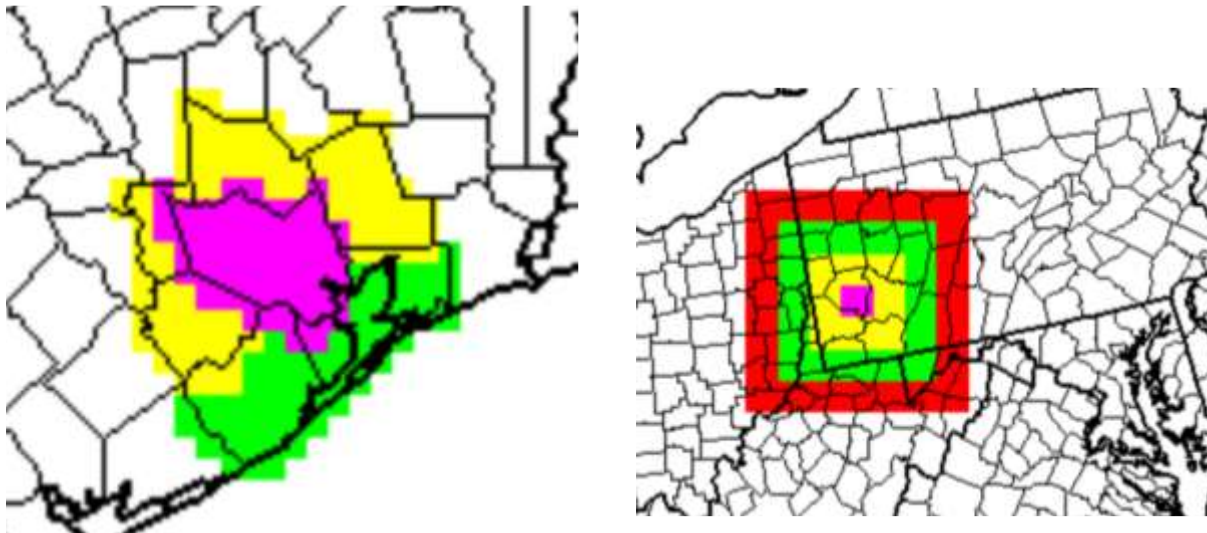

Figure 4. Source region representation for Houston (left) and Pittsburgh (right).

3.4 Modeling Using Source Apportionment

Each of the source or region categories was tagged as an individual source group to be tracked by PSAT. PSAT was run for the full year to track contributions of sulfate, nitrate, and direct (primary) PM on $PM_{2.5}$. Sulfate and nitrate were run as one set of simulations, and direct PM was run in a different set of simulations. Splitting the simulations reduces the model memory requirements and enables better parallelization of the runs, at a penalty of increased overall computations. All source apportionment modeling was run on the full CONUS domain in a set of quarterly simulations initialized on the 15th of the preceding quarter. The *source-sector* CAMx simulations required 14,300 Intel Xeon processor days to complete and generated 15,000 Gbytes of model output. The *source-region* simulations required approximately half the computing resources.

The PSAT tool within CAMx includes separate tracers that track the NO_x contributions to $PM_{2.5}$ nitrate, and SO_2 contributions to $PM_{2.5}$ sulfate. However, respective concentrations do not include mass associated with any neutralizing cations such as ammonium. In addition, PSAT does not account for indirect precursor effects, such as the impact of NO_x on sulfate formation or SO_2 on nitrate formation.

The CAMx 2026 model output was post-processed using cross-references between the raw CAMx output species names with PM species needed for SMAT-CE. The results of the post-processing are gridded 24-hour average PM species as matched to the SMAT-CE species and shown in Table 2. The PSAT tracer species are mapped to the SMAT-CE species using the relations in Table 3.

Table 2. CAMx 7.1 Raw Output Species to SMAT Input Variables.

SMAT-CE Species	Raw CAMx 6.40 Species
Sulfate (SO4)	PSO4
Nitrate (NO3)	PNO3
Ammonium (NH4)	PNH4

CM	PCC+PCS
PM25	PFN+PFC+PFE+PMN+PMG+PK_+PCA+PAL+PSI+PTI+POA+PEC+PS4+PN3+PN4

Consistent with EPA’s documented approach for source apportionment (EPA, 2018), the 12km CAMx PSAT model run was performed from January 1 through December 31 using the projected 2026 future case emissions and 2016 meteorology. The hourly contributions from each tag were processed to calculate daily average contribution metrics. Alpine used EPA’s SMAT-CE tool and top modeled days (across the “3x3” neighborhood for each monitor) to develop source apportioned concentration files from which contribution metrics were calculated. This allows the contribution metrics to be consistent with the future year design values generated from these files.

The following approach was used in preparing the SMAT-CE input files, running the SMAT-CE software, and analyzing the results:

1. Annual PM SMAT-CE was run for the 2026 future base case using base case 2016 and future year 2026 full model SMAT-CE input files. This prepares the 2026 output files which were used as the basis for comparison with the “tagged” SMAT-CE output described below.
2. Annual PM SMAT-CE files were generated for each of the source-regions or source-sectors using the species definitions in Table 3.
3. SMAT-CE was then run (in batch mode) for each future year tag-specific input file generated in Step 2 using the base case 2016 SMAT-CE input file as the base year. In these runs, SMAT-CE was configured identically as in Step 1 except for using the future year “tagged” input files generated in Step 2. These individual runs generated SMAT-CE output files that contain the forecasted PM data of the tagged contribution.
4. The PM concentration for each tag was calculated from the SMAT-CE future year base case output file and each of the tag output files.

4.0 RESULT PRESENTATION

Each monitor has been processed to be able to document the modeled PM_{2.5} concentrations and contribution (in $\mu\text{g}/\text{m}^3$) from each *source-region* or *source-sector* based on the projected 2026 annual PM_{2.5} design value. From these data, results can be averaged across counties, states, core-based statistical areas (CBSAs) or other aggregated domains based on user interest. Results include all regulatory PM_{2.5} monitors that meet the necessary completeness criteria and are included in the EPA SMAT-CE distribution.

Only traced species are reported (particulate sulfate, particulate nitrate, elemental carbon, organic carbon, ammonium, and crustal material) with non-traced components (sea salt, secondary organic aerosols, water-bound particulate matter, and blank mass) excluded from the reports. While these non-traced components are part of the overall monitor level modeled PM_{2.5} concentrations, they cannot be allocated to the category or region level with the configurations of the runs and therefore are not independently reported here.

4.1 Source-Sector Based Simulation

The first of the two simulations reported in this document are those from the category-based PSAT simulation. In this *source-sector* run, thirty-nine (39) individual emission groups were modeled. Each category was post-processed separately with traced species compared and reported for each. From a maximum contribution standpoint by category, Table 4 compares the maximum modeled contribution of total traced species PM_{2.5} (in both percent and concentration) of each category to monitors in the modeling domain.

Table 4. Maximum Contribution of Annual Traced Species (by Concentration and Percent) by Source Categories to Monitors in Modeling Domain.

Geographically, the distribution of the total modeled annual $\text{PM}_{2.5}$ from the 2026 base case by monitor is represented in Figure 5. The individual circles are regulatory $\text{PM}_{2.5}$ monitors that meet the necessary completeness criteria and are included in the EPA SMAT-CE distribution with an interpolated spatial field overlay. Spatial fields were calculated using the SMAT-CE Voronoi Neighbor Averaging (VNA) algorithm. This algorithm interpolates data to unmonitored locations by first identifying the set of monitors that best “surround” the center of the population grid cell, and then takes an inverse-distance weighted average of the monitoring values.

The top ten maximum contributing categories by traced species concentrations for any individual monitor modeled with concentrations greater than 9.0 $\mu\text{g}/\text{m}^3$ (Table 4) are represented in Figure 6 through Figure 15 below. To best demonstrate the spatial distribution of each tagged category, the following Figures are represented by the tagged species of highest concentration as modeled within each individual category.

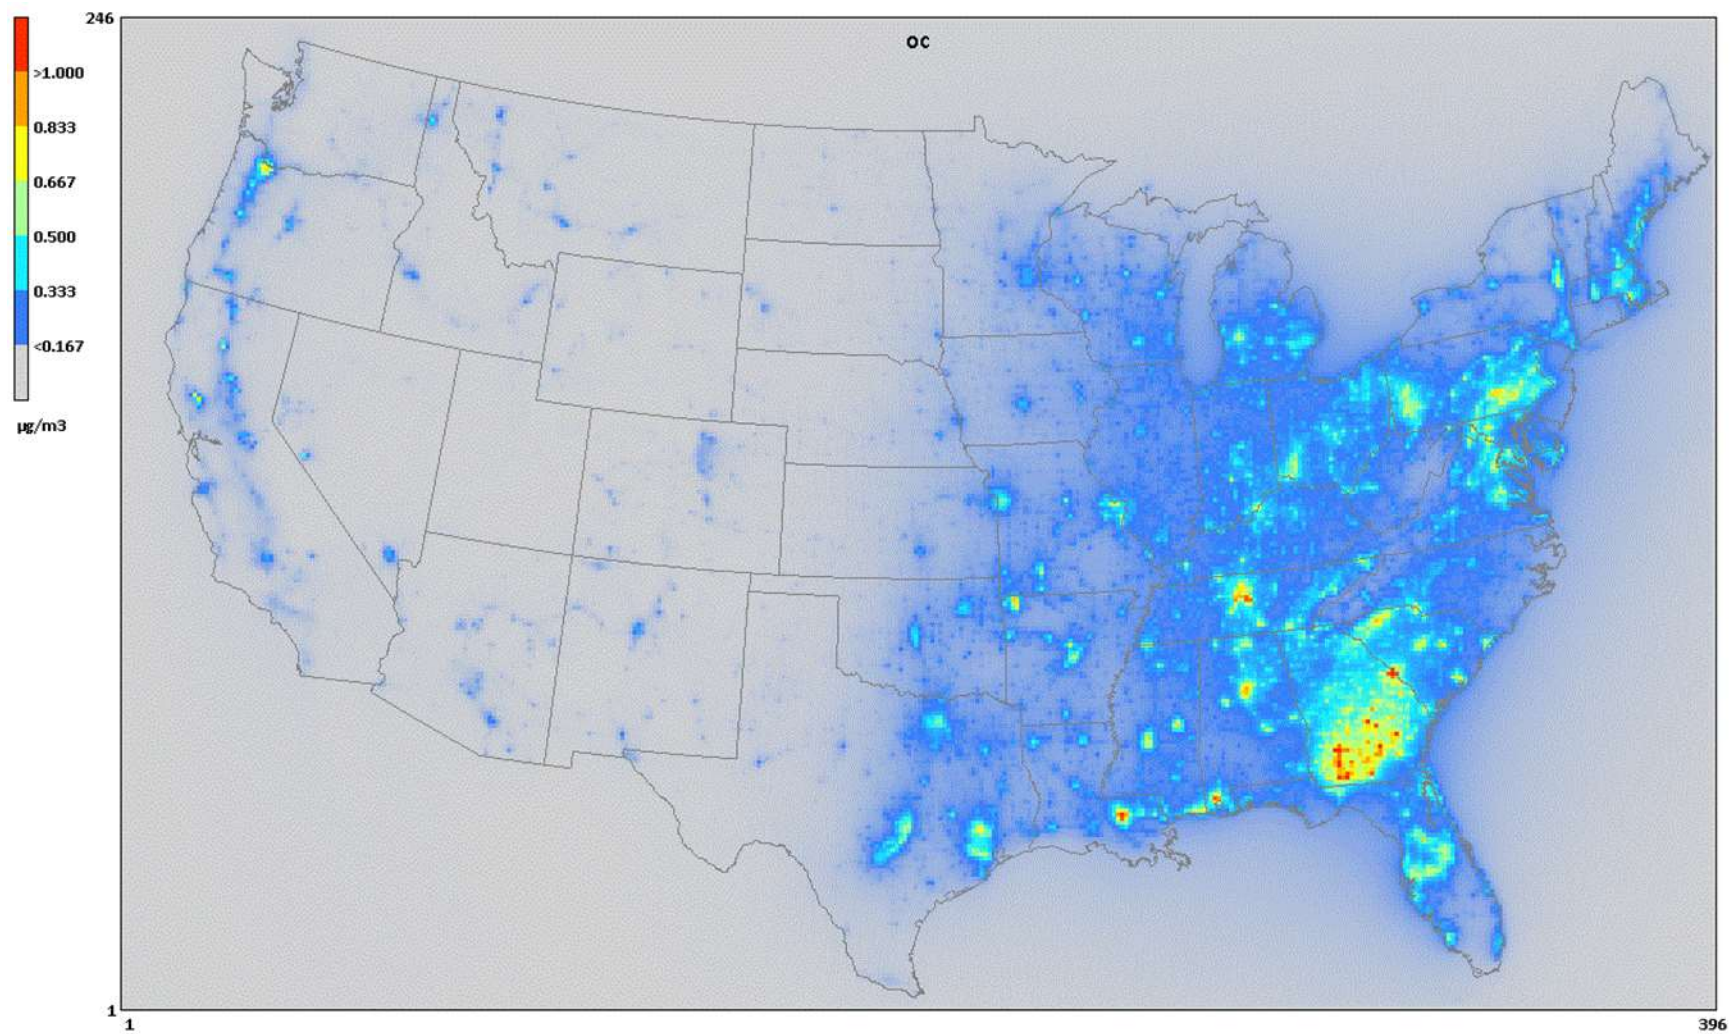

Figure 14. Modeled annual organic carbon concentrations ($\mu\text{g}/\text{m}^3$) from 2026 base case simulation for waste disposal category.

July 2024

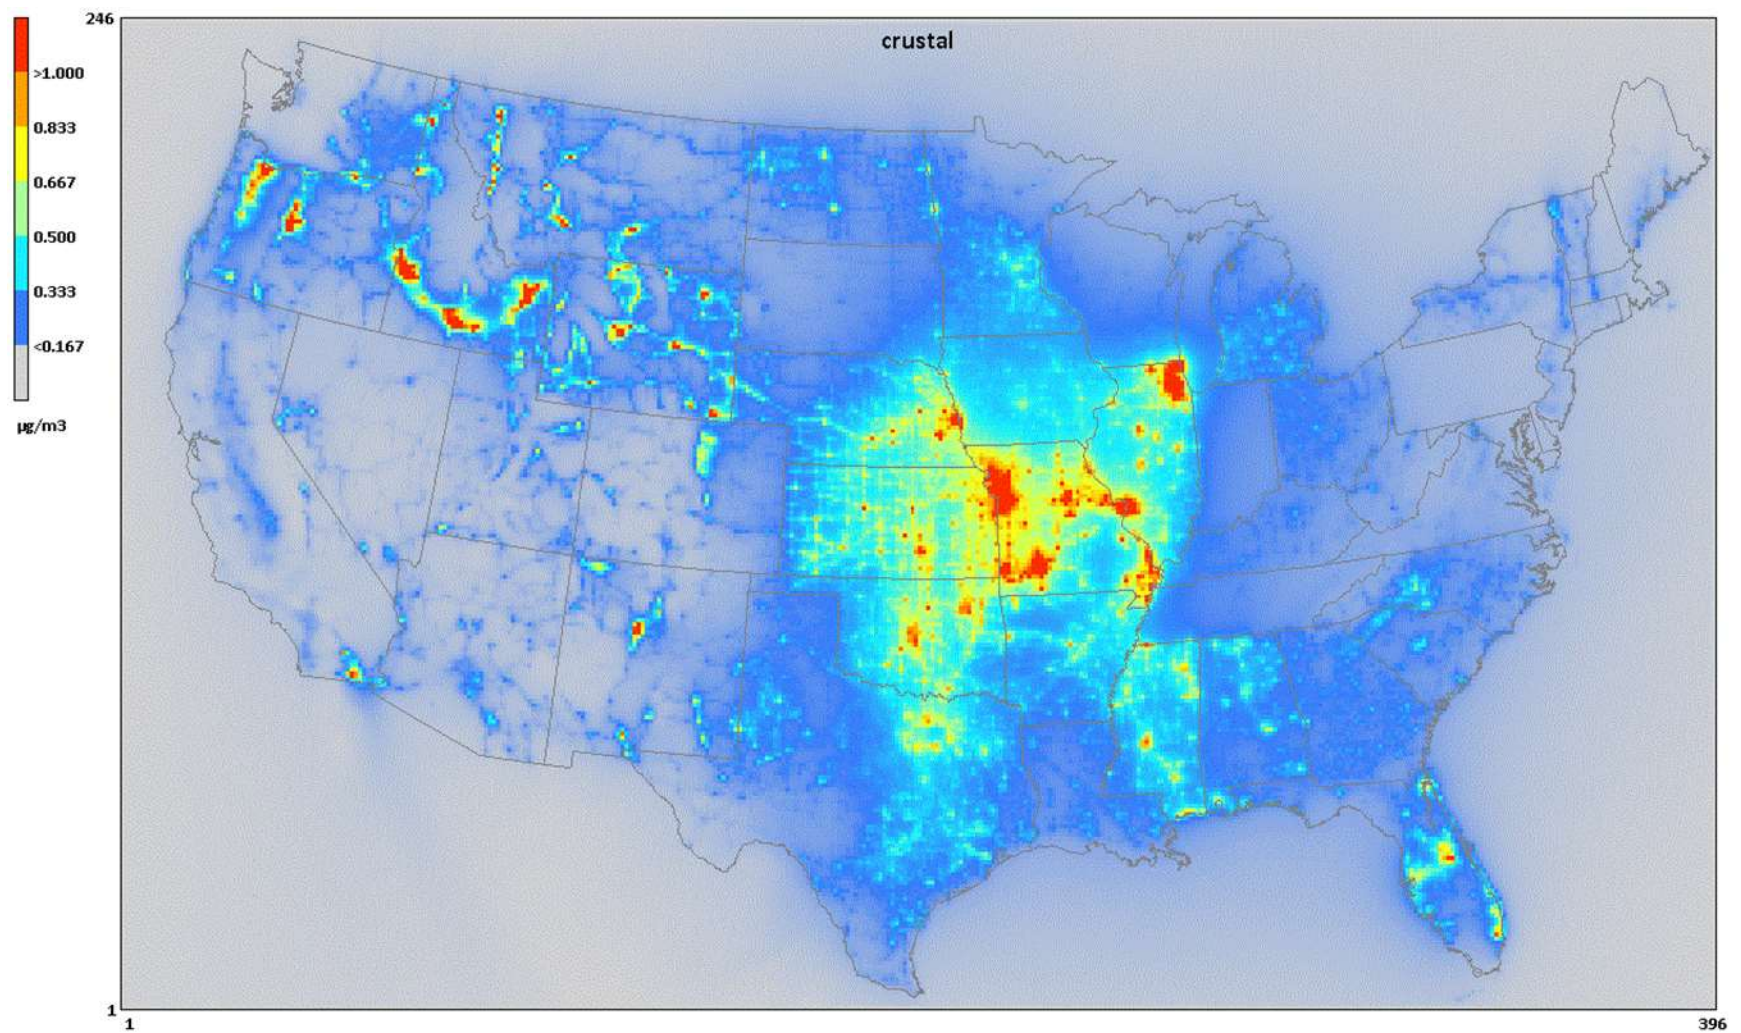

Figure 15. Modeled annual crustal mass concentrations (µg/m³) from 2026 base case simulation for unpaved roads category.

The number of times each tag was identified in the top 10 contributing categories for each monitor in the modeling domain was also reviewed. Of the total 834 monitors in the 12km modeling domain, only the boundary condition category was identified in the top 10 of every monitor. Following was residential wood combustion (818 monitors), commercial cooking (669), waste disposal (643), coal-fired EGUs (614), prescribed fires (582), stationary non-EGUs (555), wildfires (480), Canadian and Mexican anthropogenic (432), and biomass fuel combustion (373).

For the 306 monitors that were modeled to exceed the $9.0 \mu\text{g}/\text{m}^3$ NAAQS, again only the boundary condition category was identified in the top 10 of every monitor. This was followed by residential wood combustion (303 monitors), commercial cooking (296), waste disposal (216), coal-fired EGUs (196), stationary non-EGUs (188), prescribed fires (186), wildfires (182), diesel vehicles (170), and non-diesel vehicles (163).

The significance of the high percentage of monitors with controllable emission contributions is corroborated by EPA and documented in the Regulatory Impact Analysis of the final rule (EPA, 2024a). In this document, EPA notes that to achieve a level of the NAAQS at $9.0 \mu\text{g}/\text{m}^3$ annually and $35 \mu\text{g}/\text{m}^3$ daily, among the greatest potential emission reductions to be applied (18,593 tons $\text{PM}_{2.5}$ total reduction) are found from the commercial cooking category (4,388 tons of $\text{PM}_{2.5}$ / 24% of all estimated emission reductions), waste disposal – all categories (3,009 tons / 16%), residential wood combustion (1,636 tons / 9%), and industrial processes – not elsewhere classified (1,526 tons / 8%); all categories within the top 5 contributing categories to monitors exceeding $9.0 \mu\text{g}/\text{m}^3$ in the 2026 base case.

4.1.1 Monitor Specific Results

Source apportionment data by source category and traced species was prepared for each monitor in the modeling domain. Below is detailed information that is also provided for each of the monitors as found in the spreadsheets referenced in Appendix B. Monitors in this section were highlighted by EPA as potentially needing additional emissions reductions to meet the level of the new NAAQS even after the application of all available PM controls (EPA, 2024).

Table 5 provides a modeled distribution by source category and traced species to monitor 340070002 in Camden County, New Jersey. This monitor has a projected annual PM_{2.5} design value of 11.43 µg/m³ in the 2026 base case. The cells are color coded to show which category-species combination has the greatest modeled value from the annual PM_{2.5} design value. Warmer colors indicate greater contribution while cooler colors indicate lower contribution.

Table 5. Tabular report of category contribution by traced species to modeled annual PM_{2.5} design value at monitor 340070002.

As is seen in this example, considered by EPA as a “near-road” monitor in the RIA, the organic carbon component of residential wood combustion ($1.2082 \mu\text{g}/\text{m}^3$) and of commercial cooking ($1.0298 \mu\text{g}/\text{m}^3$) comprise the largest contribution from the traced category-species combinations. Figure 16 presents the results of Table 5 plotted as a bar chart, with each bar representing an individual tagged category and the stacked colors of each bar representing the individual traced species of that category. The relative height of each bar represents the relative modeled concentration of each category-species to the total annual $\text{PM}_{2.5}$ design value. Consistent with the values from Table 5, the tallest bars, representing the greatest contributors to the annual design value, are from the residential wood combustion and commercial cooking categories. Both bars are also dominated by the light blue component, representing the organic carbon species.

It is noted that these tabular and graphical representations only contain the contributions of the traced species from the tagged categories. Because of the inability to trace non-tagged components of the model simulation and assign them to individual categories, the $\text{PM}_{2.5}$ concentrations associated with secondary organic aerosols, sea salt, particle bound water, and “blank mass” at each monitor are not presented, although their values are calculated by SMAT-CE and included in the total annual $\text{PM}_{2.5}$ design value.

Top 10 tables and charts are available for each monitor and examples for the Camden County, New Jersey monitor are presented in Table 6 and Figure 17.

Like the previous table representing the category-species combination contributions, combinations with the highest contribution to the annual design values are in warmer colors. In Table 6 below, an additional column is provided which sums the total of the traced species to provide a full accounting of each of the top categories.

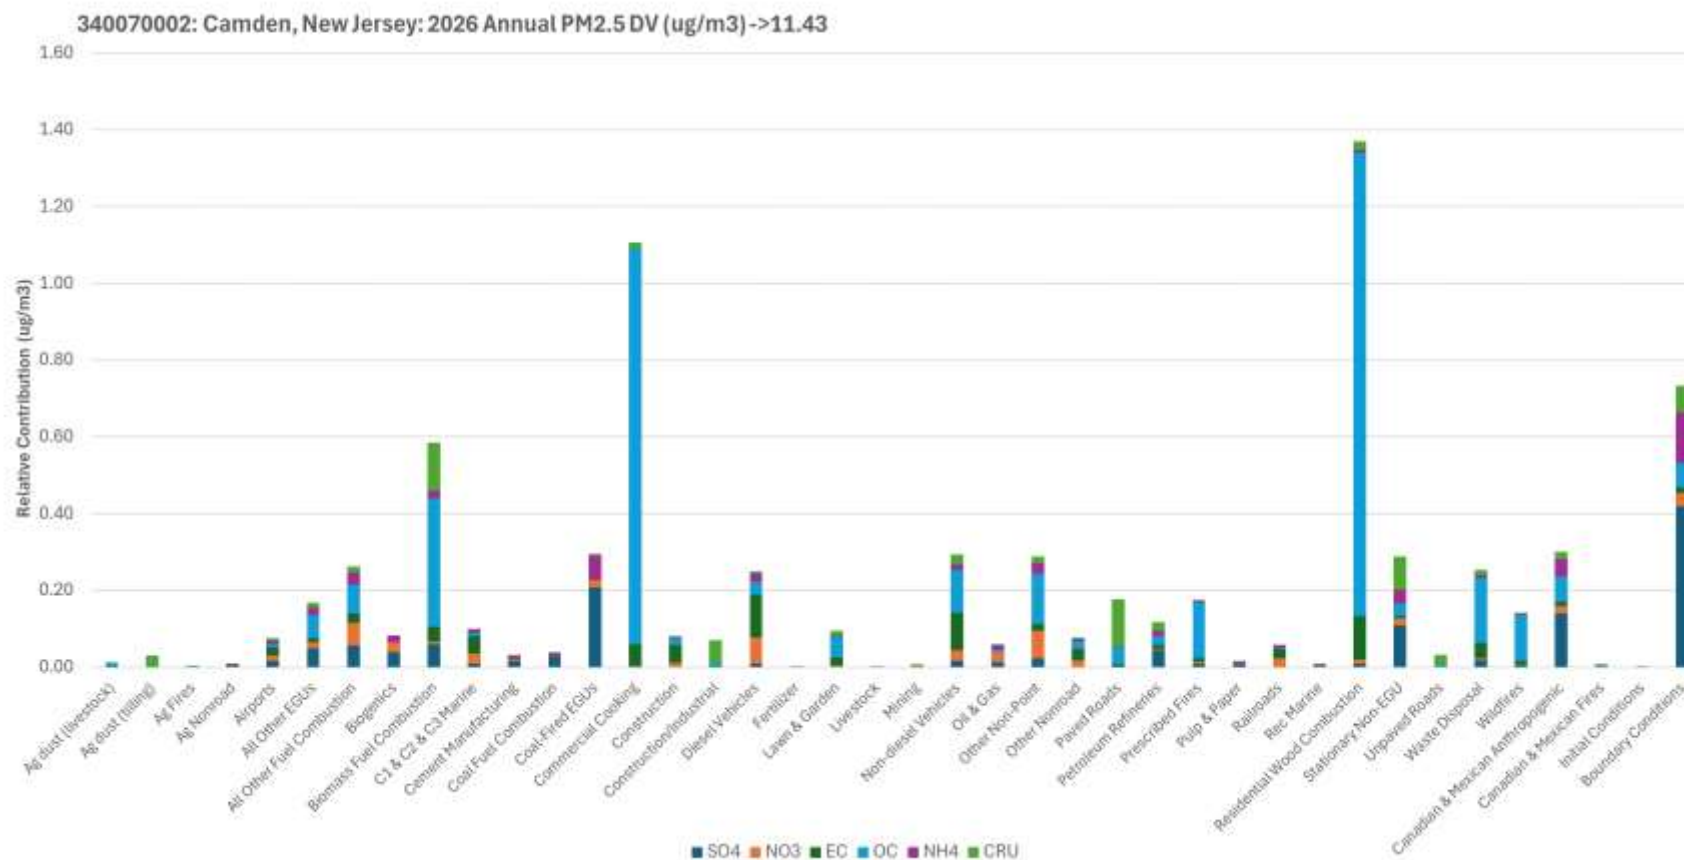

Figure 16. Stacked bar chart of category and traced species to modeled annual PM_{2.5} design value at monitor 340070002.

Each monitor has a unique pattern of source category contributions. While the majority of urban or “near-road” classified monitors tends to demonstrate high contributions from the commercial cooking, residential wood combustion, and waste disposal sectors, top 10 tables and charts help to understand the uniqueness of monitors in other non-urban settings.

Presented in Table 7 is a “border area” monitor, located in Hidalgo County, TX; monitor 482150043. Here, a location adjacent to the international border with Mexico near the Gulf of Mexico, total traced species from boundary conditions (3.513 µg/m³) and Canadian & Mexican anthropogenic categories (1.105 µg/m³) dominate the contribution to the overall annual PM_{2.5} design value (11.14 µg/m³). While the domestic anthropogenic source categories of commercial cooking (0.546 µg/m³), paved roads (0.231 µg/m³), and residential wood combustion (0.227 µg/m³) are in the top six categories, even complete removal of these domestic sources from the contribution would not generate enough air quality improvement to model attainment at this monitor.

Table 7. Tabular report of top 10 category contribution by traced species to modeled annual PM_{2.5} design value at border area monitor 482150043 in Hidalgo County, Texas.

Finally, Table 8 presents the top 10 categories from a “small mountain” monitor in Lemhi County, Idaho. Here it is seen that wildfire, boundary conditions, prescribed fires, and residential wood combustion dominate the composition to the total annual design value.

Table 8. Tabular report of top 10 category contribution by traced species to modeled annual PM_{2.5} design value at small mountain monitor 160590004 in Lemhi County, Idaho.

NH4 = Ammonium							
CRU = Crustal Material							

These top 10 tables may be useful for air agencies to help guide development of control programs needed to bring individual monitors into modeled attainment with the NAAQS.

Figure 17 presents another representation of the top 10 categories compared to all “other traced categories” (i.e., the remaining twenty-nine categories combined not in the top ten). This presentation is useful in demonstrating the relative contribution of each category to the total modeled concentrations at each monitor. Like Table 6, this figure is useful in communicating which categories at the Camden County near-road monitor are contributing, and may be useful to control, to achieve needed air quality improvement at the monitor represented.

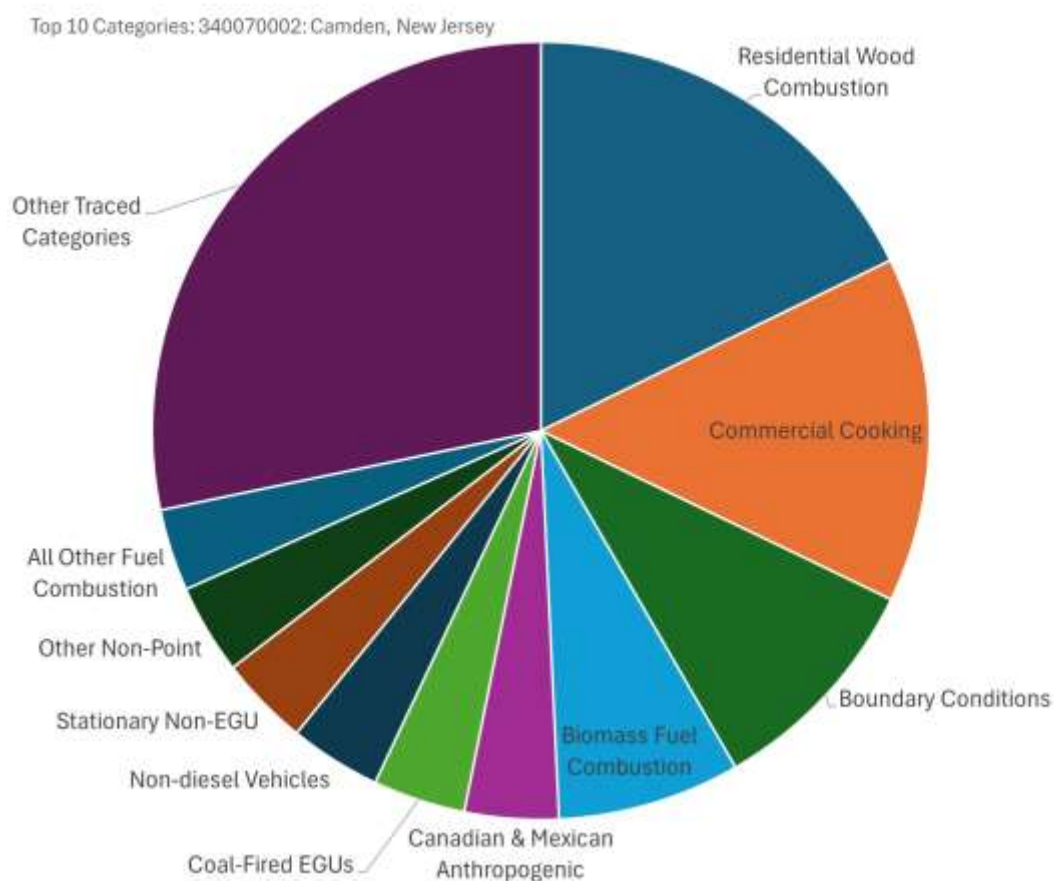

Figure 17. Pie chart of top 10 category contributions (and all other traced categories combined) at near-road monitor 340070002 in Camden County, New Jersey.

The pie charts in Figure 18 also demonstrate the potential difficulty in achieving modeled attainment at the Hidalgo County border monitor (left) and the Lemhi County small mountain monitor (right) when typical uncontrollable categories dominate the PM_{2.5} concentrations modeled at these locations.

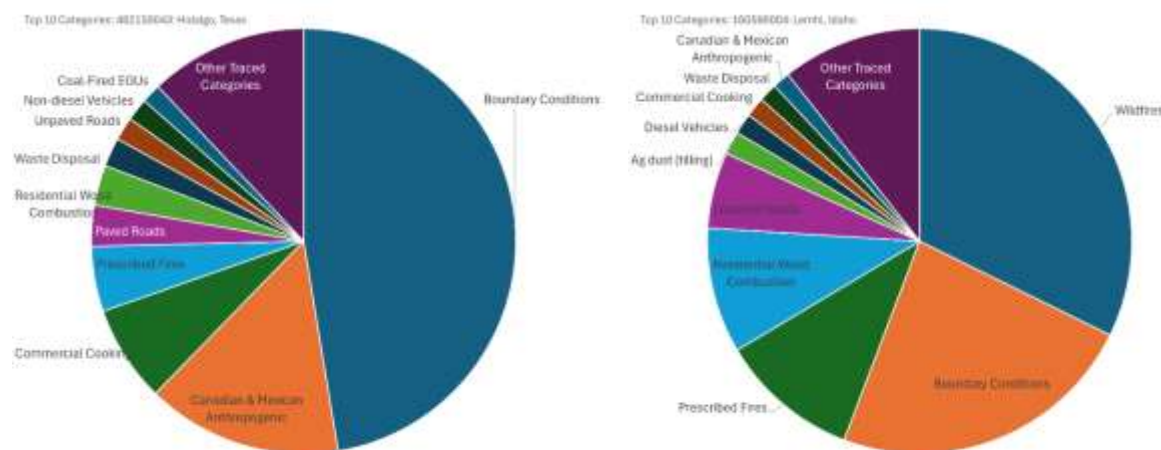

Figure 18. Pie charts of top 10 category contributions (and all other traced categories combined) at border monitor 482150043 in Hidalgo County, Texas (left) and at small mountain monitor 160590004 in Lemhi County, Idaho (right).

4.1.2 Geography Specific Results

Source apportionment data by region and traced species was additionally prepared for each monitor in the modeling domain using the seven metropolitan areas noted in Figure 19 below. Results in this section are presented for the key monitors listed in Table 9.

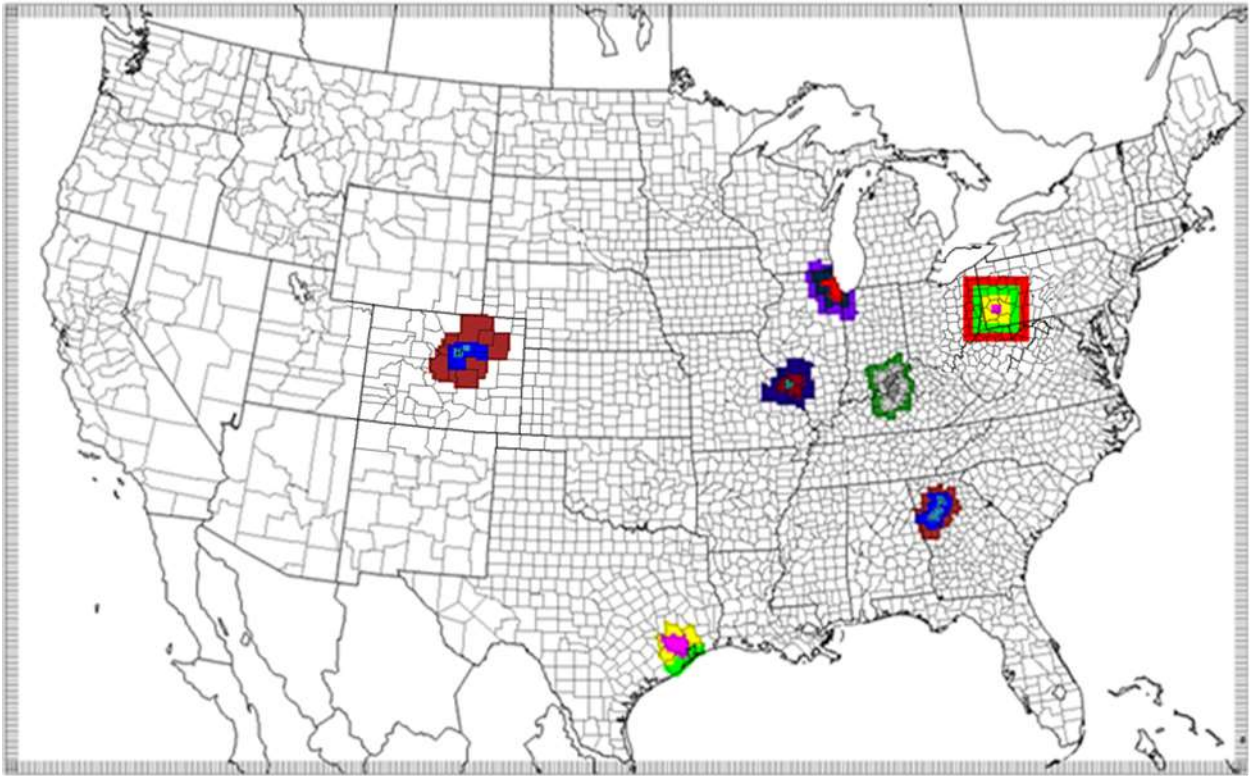

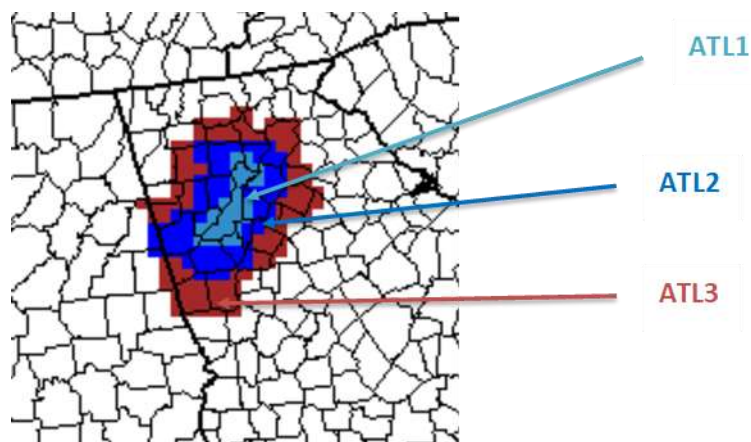

Figure 19. Source region representation for PSAT run.

Table 9. Key monitors reviewed in geographic PSAT simulation.

Monitor	Region	Monitor Location	Region Appreviation	Configuration	2026 Base DV ($\mu\text{g}/\text{m}^3$)
131210056	Atlanta	Fulton, GA	ATL	County Centered	11.49
170313103	Chicago	Cook, IL	CHI	County Centered	11.73
080310028	Denver	Denver, CO	DEN	County Centered	11.36
290990019	St. Louis	St. Louis, MO	STL	County Centered	9.94
482011035	Houston	Harris, TX	HOU	County Centered w/ NW + SE Outer	11.63
211110043	Louisville	Jefferson, KY	LOU	NAA Centered	10.58
420030064	Pittsburgh	Allegheny, PA	PIT	Grid Centered	13.37

Each concentric ring of counties or grid cells are incrementally numbered in the results presented below. Prefixes are representative of the region name (e.g., CHI = Chicago, ATL = Atlanta, etc.) with the location of the key monitor identified in the first ring of cells (e.g., ATL 1) and emissions from rings moving from the center are identified by incremental numbering (e.g., ATL 2 and ATL 3). Example identification is provided for the Atlanta domain in Figure 20 below.

**Figure 20. Example contribution ring identification for Atlanta domain.**

Contributions to each monitor are calculated in a relative sense to quickly identify the percentage of anthropogenic emissions from each source region and their contribution to modeled $\text{PM}_{2.5}$ concentrations at the key monitors. In the following tables and figures, each of

the seven regions are presented separately although all regional contributions are calculated for each monitor.

Table 10 through Table 16 present traced species contributions by each of the twenty-three (23) regions, by anthropogenic and natural category breakouts, plus boundary condition contribution and the non-traced component of the annual $PM_{2.5}$ design value.

Figure 21 through Figure 27 present comparable data in a graphical format.

As expected, the greatest contributions come from within the regions in closest proximity to, or containing, the county or grid cell within which the monitors are located. With a few exceptions, as noted below, the relative contribution of anthropogenic emissions to $PM_{2.5}$ concentrations diminishes significantly with increases in distance from the monitor. In other words, the farther away the source is from the monitor, the smaller the contribution to the modeled $PM_{2.5}$ concentrations; an inverse distance ratio.

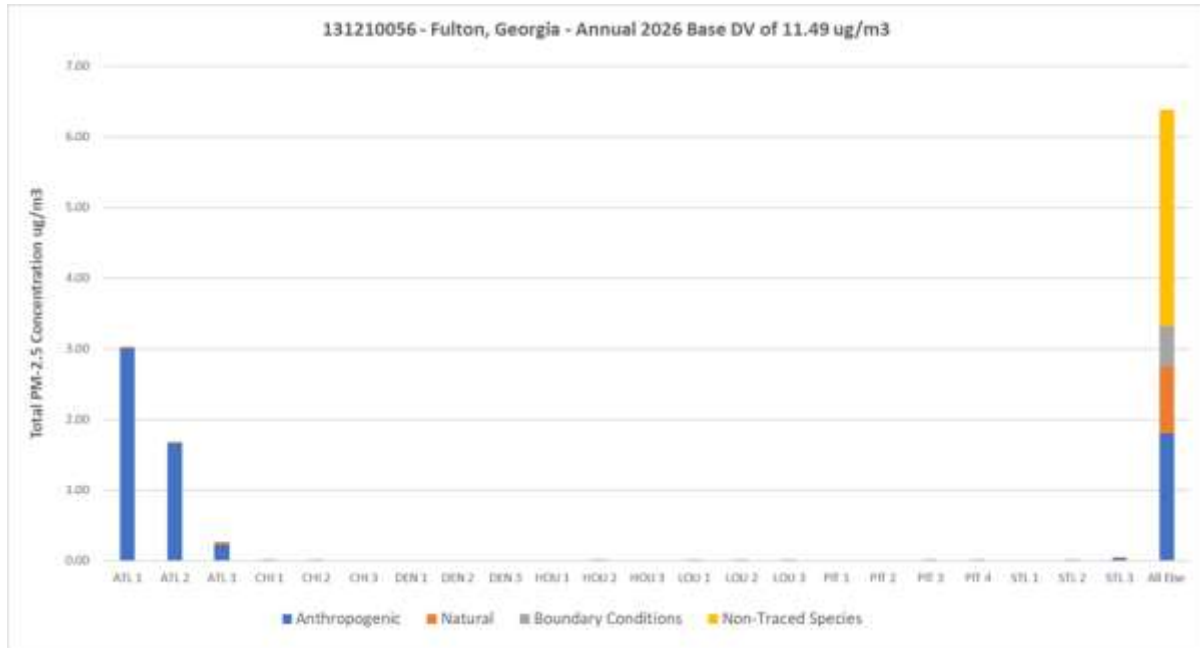

This inverse distance ratio is corroborated by EPA in their RIA (EPA, 2024) as they calculated the air quality ratios (change in DV compared to change in emissions) needed to estimate the emissions necessary to achieve various levels of the NAAQS. In this calculation, EPA found that “resulting impact ratio suggests that primary $PM_{2.5}$ emission reductions in neighboring counties would be 4x less effective as in the core county” or alternately, that contributions from neighboring counties are approximately 75% less impactful than contributions from emissions in the county where the monitor is located.

Table 10 below presents the relative contribution of traced and non-traced $PM_{2.5}$ by source region and anthropogenic, natural (biogenic), and boundary condition categories. The primary geographical region surrounding the key monitor represented is highlighted in green.

As presented in this table, and further seen in Figure 21, the relative contribution of anthropogenic emissions from within the county where the key monitor is located (ATL 1) dominates the overall percentage of PM_{2.5} concentration modeled at this monitor. And as seen in Figure 21, as the distance from the monitor increases (ATL 2 and ATL 3), the percentage contribution of anthropogenic emissions to the modeled concentration decreases significantly.

131210056 - Fulton, Georgia - Relative Anthropogenic Contribution of Traced PM 2.5

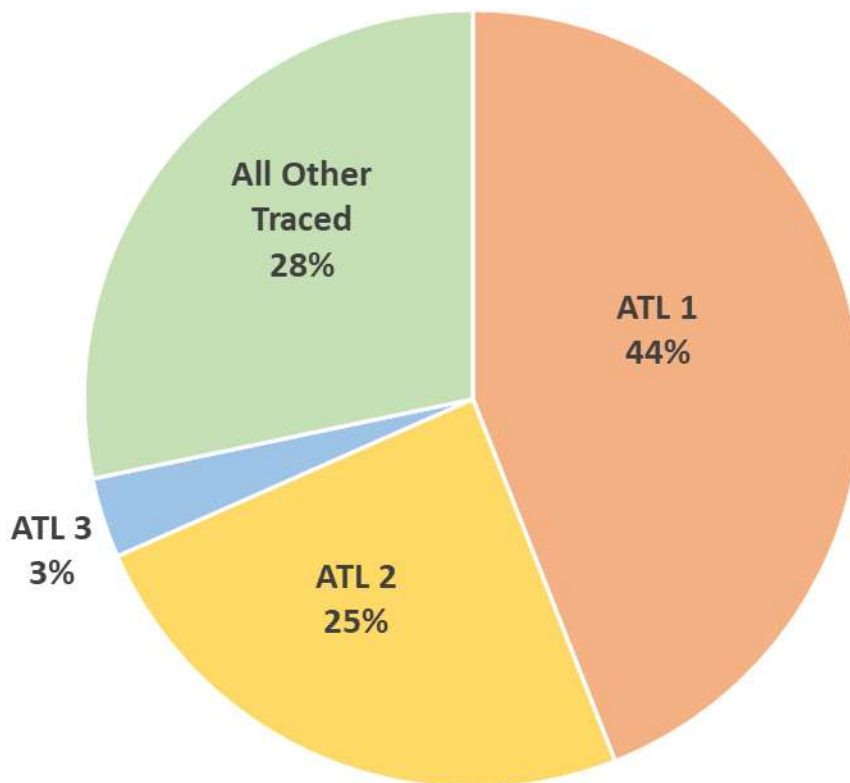

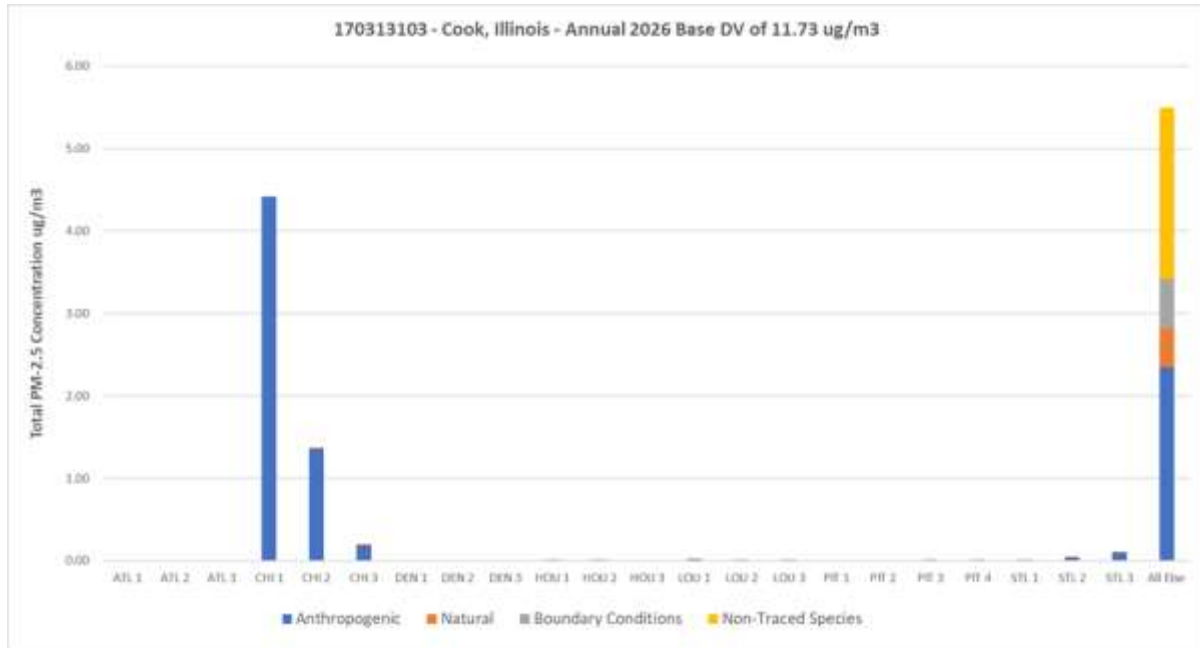

Figure 21. Relative contribution by region to Atlanta, GA monitor 131210056.

For monitor 170313103 in Chicago, IL, the urban core (CHI 1) represents 52% of the traced modeled species compared to the total modeled anthropogenic contribution (4.41 $\mu\text{g}/\text{m}^3$ of 8.52 $\mu\text{g}/\text{m}^3$). Cook County also represents most of the physical spatial extent of the analyzed Chicago domain and therefore was expected to have the greatest contribution to the monitor.

170313103 - Cook, Illinois - Relative Anthropogenic Contribution of Traced PM 2.5

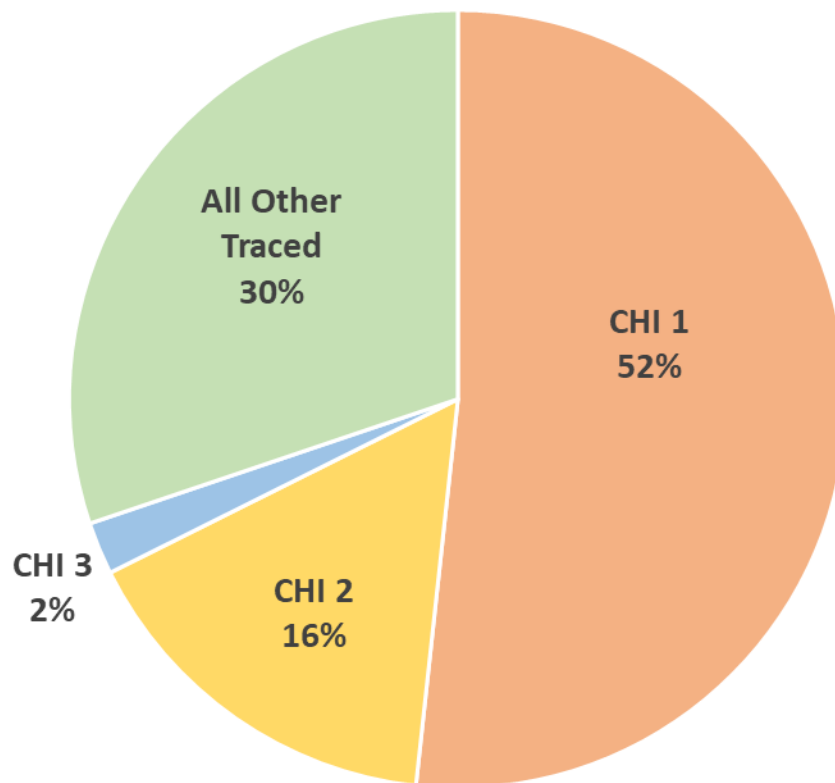

Figure 22. Relative contribution by region to Chicago, IL monitor 170313103.

Denver's urban core represents 64% of the modeled anthropogenic traced species contribution (5.78 $\mu\text{g}/\text{m}^3$ of 9.04 $\mu\text{g}/\text{m}^3$). Additionally, Denver's unique surrounding county geography plays a role in the distance to concentration ratios with distance in the second and third tier counties being significantly farther from the monitor location.

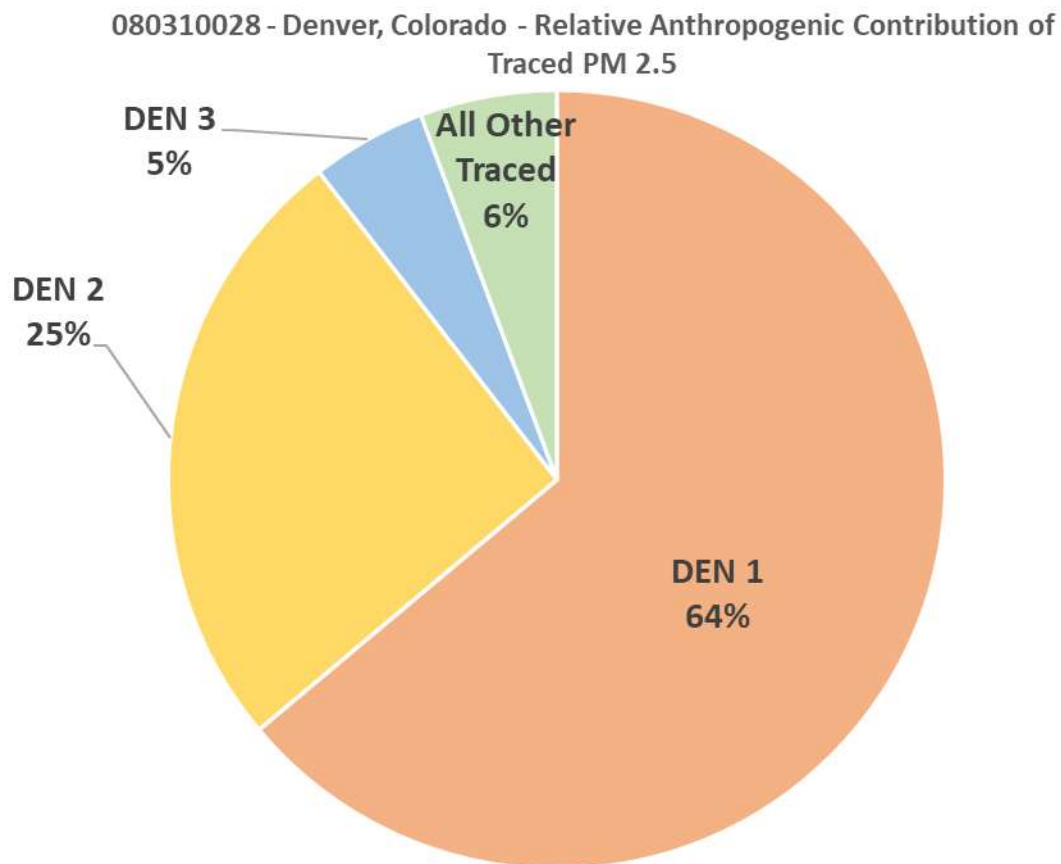

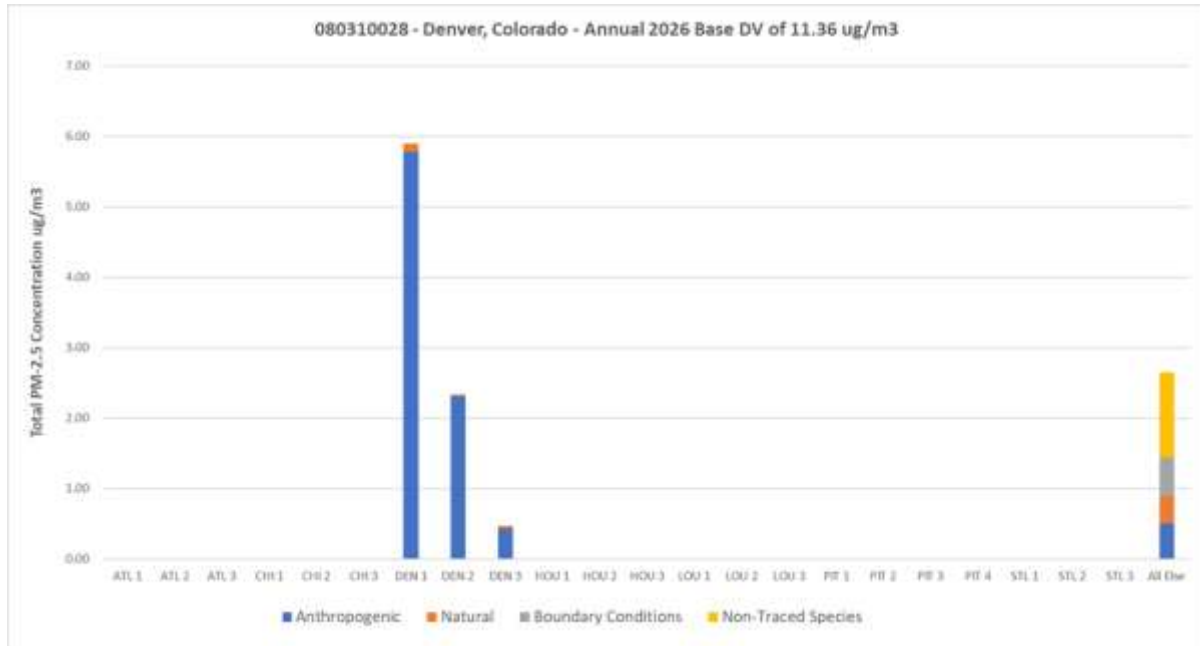

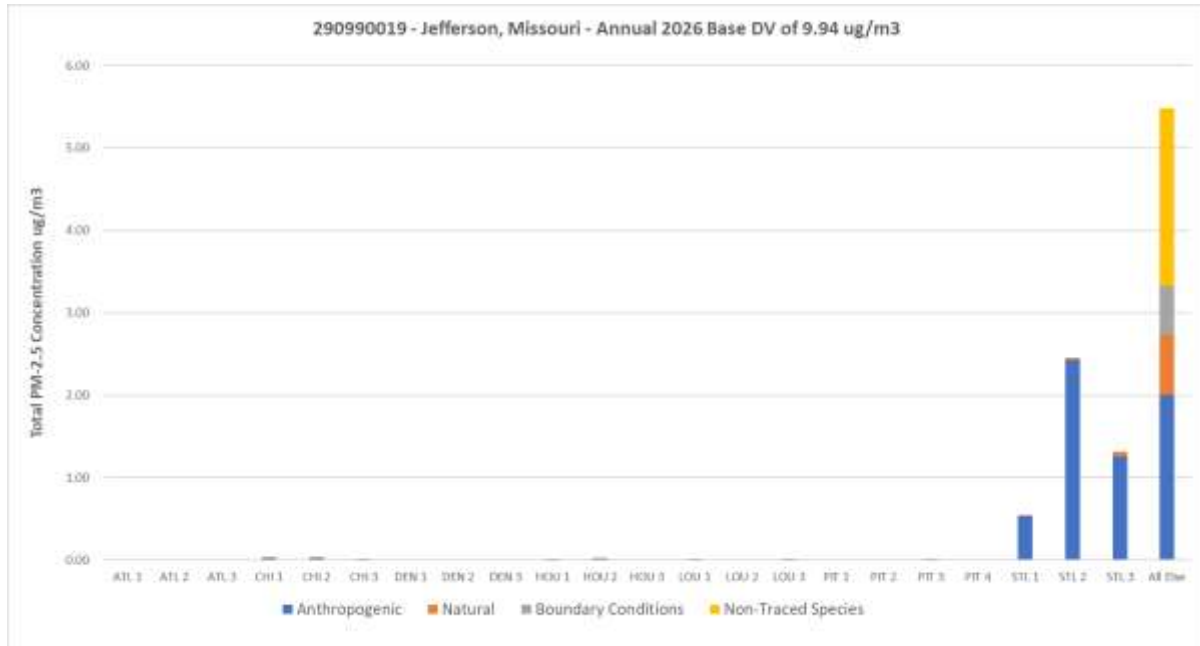

Figure 23. Relative contribution by region to Denver, CO monitor 080310028.

The St. Louis configuration reviewed a monitor in STL 1 in the Missouri side city center adjacent to the regulating monitor on the Illinois side of the nonattainment area (located in STL 2) to test how emissions within an entire multi-state nonattainment area influence modeled concentrations throughout the area. For monitor 290990019 in St. Louis, it is shown that the emissions from the Missouri-side city core represents only 8% of the traced modeled species compared to the total modeled anthropogenic contribution (0.54 $\mu\text{g}/\text{m}^3$ of 6.38 $\mu\text{g}/\text{m}^3$).

290990019 - Jefferson, Missouri - Relative Anthropogenic Contribution of Traced PM 2.5

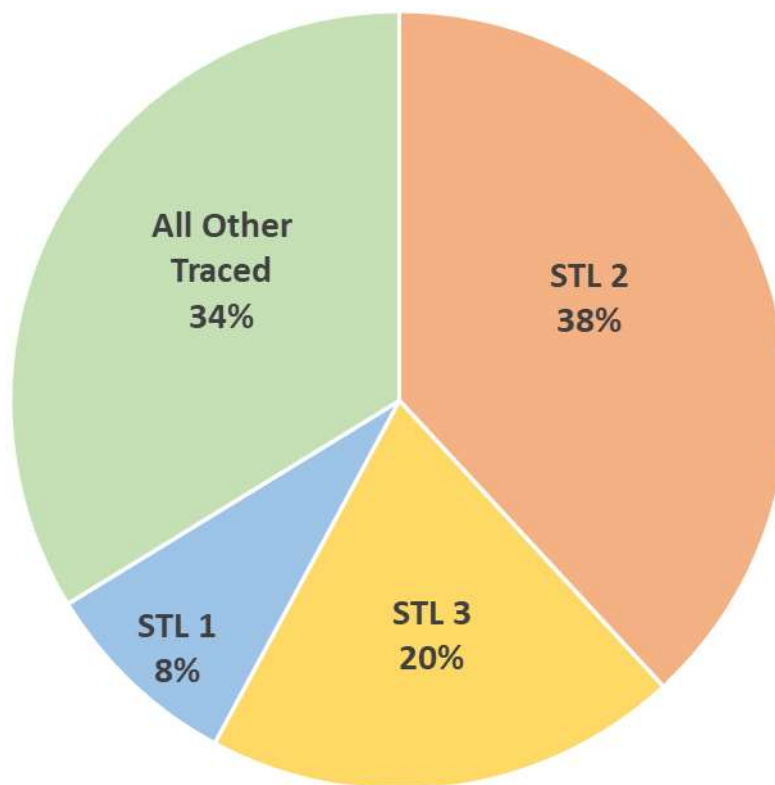

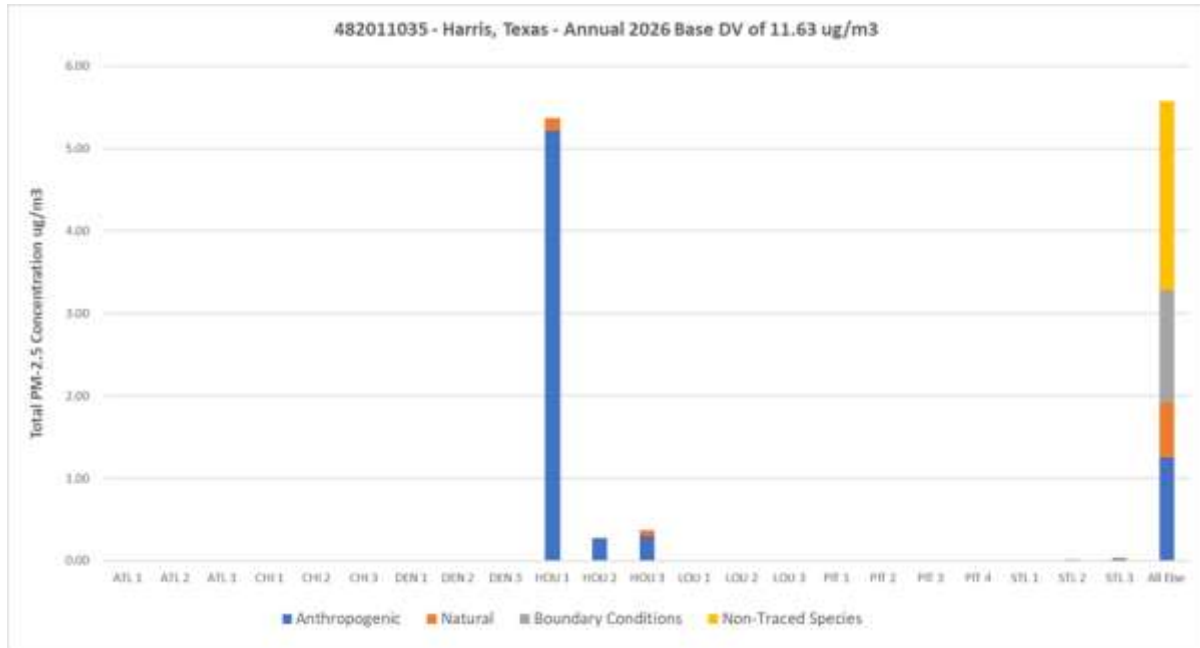

Figure 24. Relative contribution by region to St. Louis, MO monitor 290990019.

Houston's configuration investigates contributions from the city's core (HOU 1) compared to the contributions from a west (HOU 2) and eastern shipping channel (HOU 3) delineation. From the results presented below, the city's core has a significant percentage (74%) of the total anthropogenic traced species contributions to the monitor's annual design value.

482011035 - Harris, Texas - Relative Anthropogenic Contribution of Traced PM 2.5

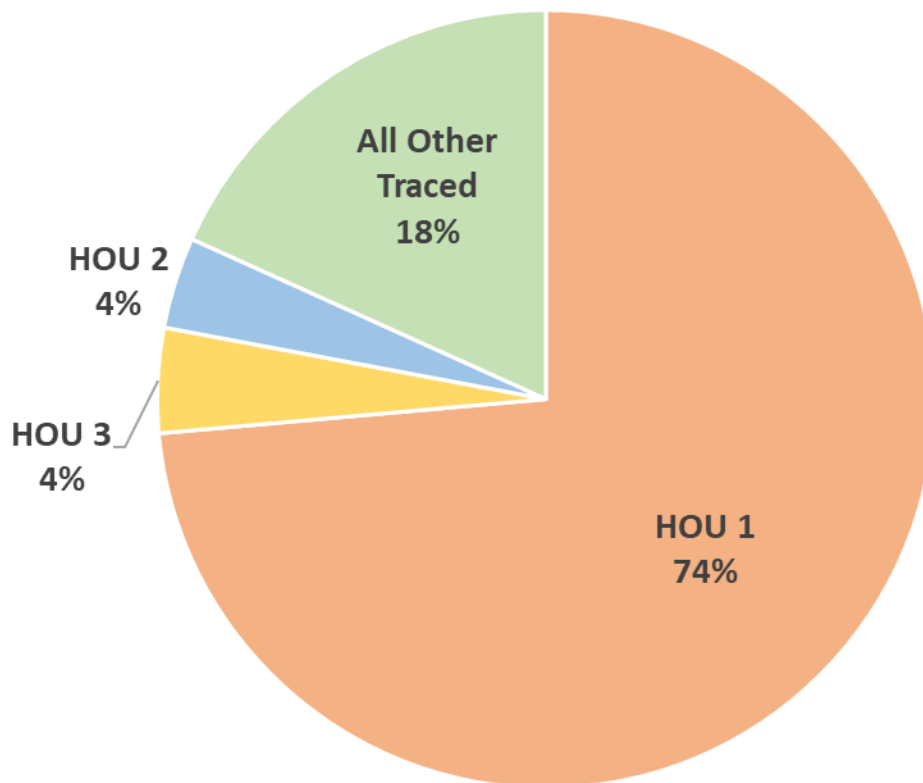

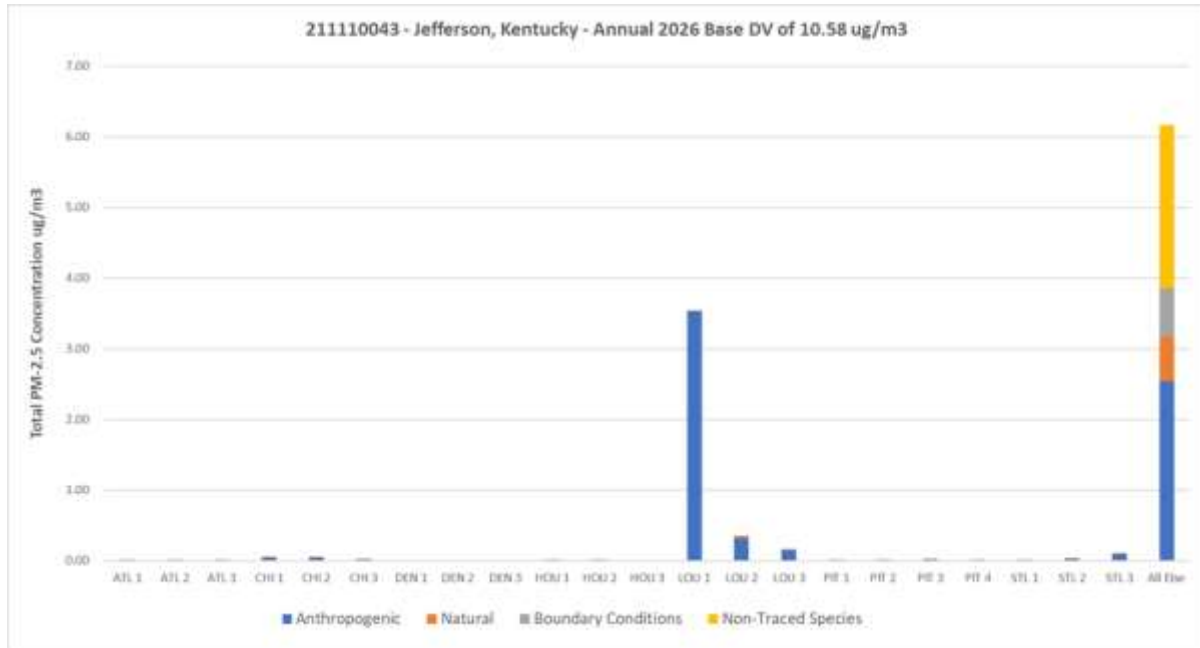

Figure 25. Relative contribution by region to Houston, TX monitor 482011035.

Louisville's urban core represents 51% of the modeled anthropogenic traced PM_{2.5} (3.52 ug/m³ of 6.99 ug/m³) recognizing that this LOU 1 region comprises counties in both Kentucky and Indiana that are part of the existing ozone nonattainment area. Contributions drop precipitously (5% and 2% for LOU 2 and LOU 3, respectively) compared to distance from the monitoring location.

211110043 - Jefferson, Kentucky - Relative Anthropogenic Contribution of Traced PM 2.5

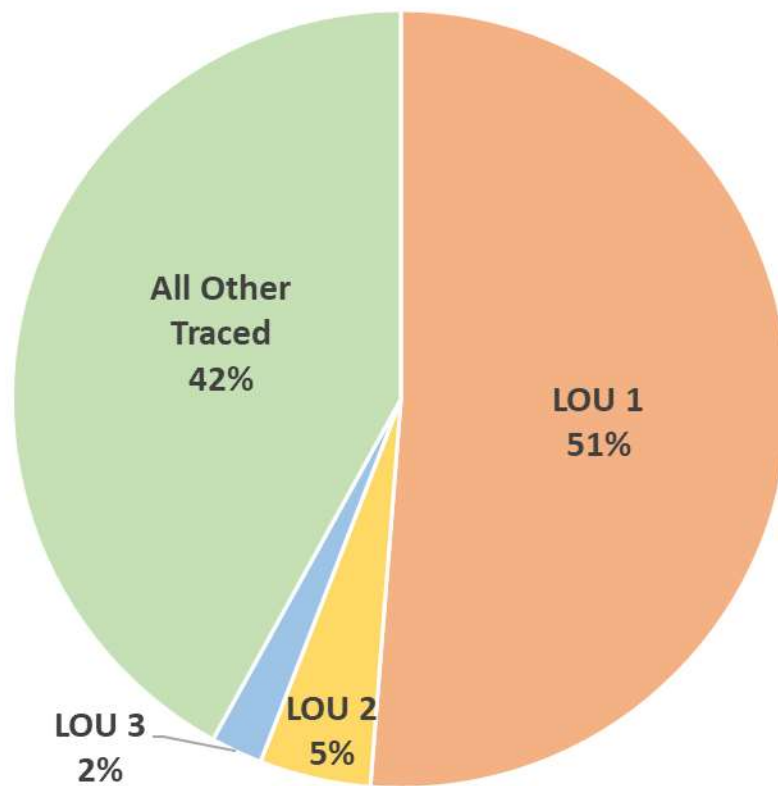

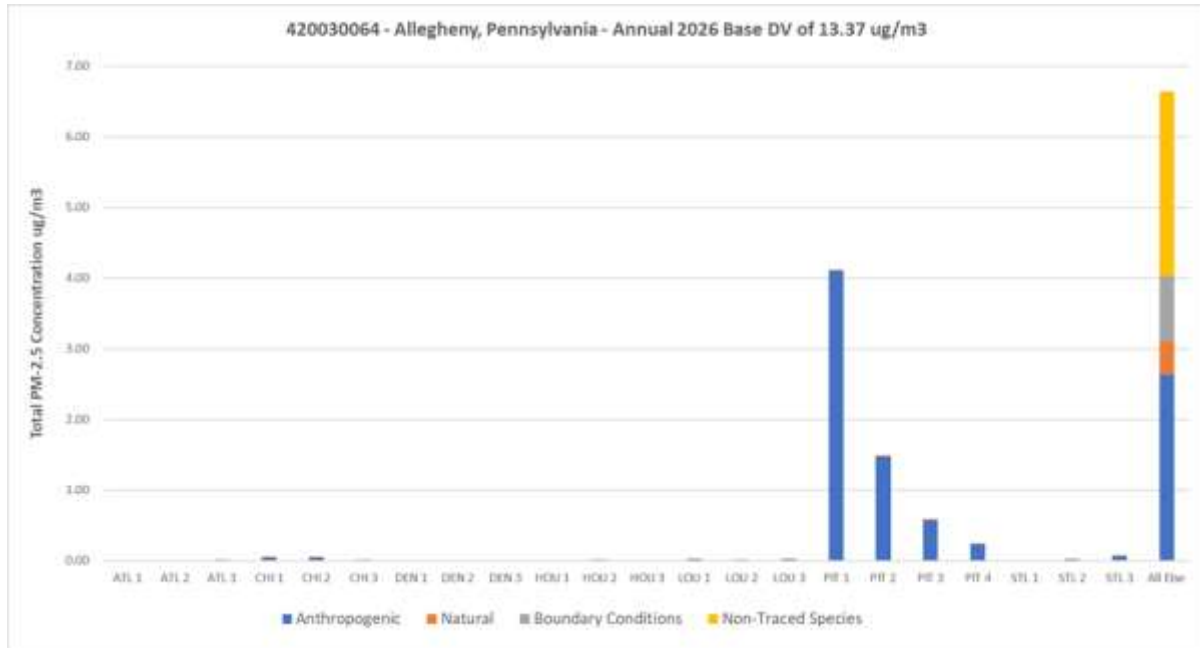

Figure 26. Relative contribution by region to Louisville, KY monitor 211110043.

The Pittsburgh monitor, configured as concentric grid cell rings, shows the same pattern as county or nonattainment area configurations with contributions decreasing with increasing distance from the monitor. The 3x3 grid cells region (PIT 1) inclusive of the monitor (but less than the entire spatial extent of the county where the monitor is located) comprises 44% of the total modeled traced PM_{2.5} at the monitor with smaller percentages (15%, 6%, and 2%) estimated with each incremental grid ring (PIT 2, PIT 3, and PIT 4), despite the increasing area covered by each grid ring.

420030064 - Allegheny, Pennsylvania - Relative Anthropogenic Contribution of Traced PM 2.5

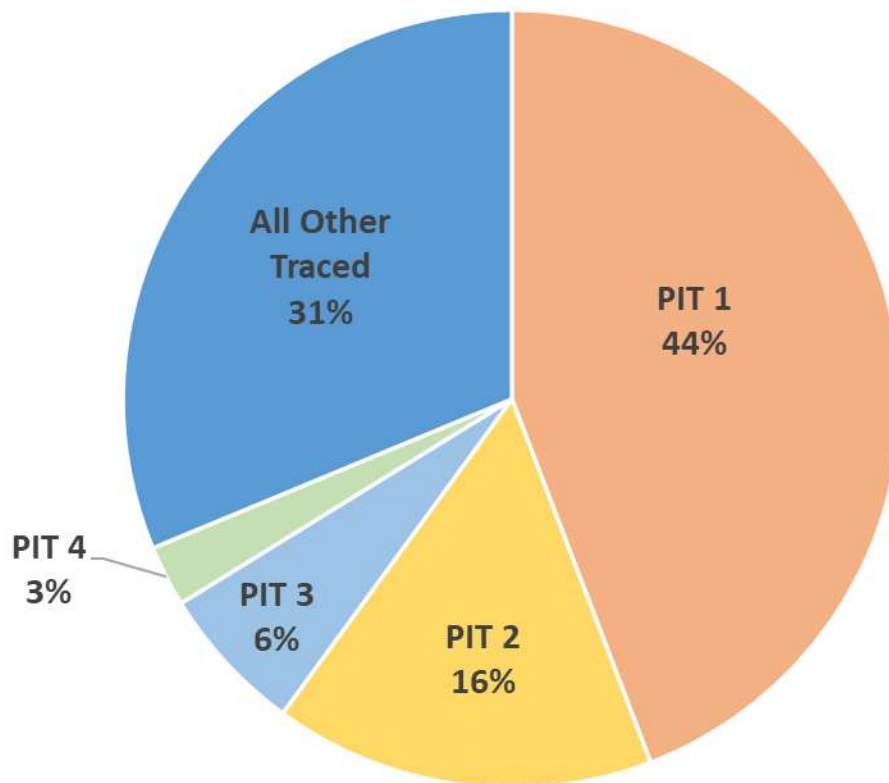

Figure 27. Relative contribution by region to Pittsburgh, PA monitor 420030064.

5.0 OBSERVATIONS

In most modeled regions, the urban core dominates the modeled $\text{PM}_{2.5}$ concentration. The analysis supports that designation should focus on local areas around monitored exceedances with limited evidence supporting transport of PM concentrations from distance. This is consistent with EPA findings that concentrations are most responsive to changes in local emissions and neighboring counties (even small) show nominal sensitivity to contribution or control to monitors.

In urban area locations, anthropogenic emissions from commercial cooking, residential wood combustion, and waste disposal have the highest percentage of modeled $\text{PM}_{2.5}$ concentrations. At monitors near international borders, total traced species from boundary conditions and Canadian and Mexican anthropogenic categories dominate the modeled contribution to the overall annual $\text{PM}_{2.5}$. Finally, at remote mountain monitors, wildfire, boundary conditions, prescribed fires, and residential wood combustion dominate the composition to the total annual $\text{PM}_{2.5}$ concentrations.

ptnonipm - 30700987	Industrial Processes;Pulp and Paper and Wood Products;Medium Density Fiberboard (MDF) Manufacture;Sawing Operations: Post-Board Cooler: Urea Formaldehyde Resin	24	Pulp & Paper
ptnonipm - 30700991	Industrial Processes;Pulp and Paper and Wood Products;Medium Density Fiberboard (MDF) Manufacture;Panel Trim Hammermill/Chipper	24	Pulp & Paper
ptnonipm - 30700994	Industrial Processes;Pulp and Paper and Wood Products;Medium Density Fiberboard (MDF) Manufacture;Combined Process Unit Type Dust Collection: Dry Wood Material	24	Pulp & Paper
ptnonipm - 30700995	Industrial Processes;Pulp and Paper and Wood Products;Medium Density Fiberboard (MDF) Manufacture;Combined Process Unit Type Dust Collection: Mixed Dry and Green Wood Material	24	Pulp & Paper
ptnonipm - 30700996	Industrial Processes;Pulp and Paper and Wood Products;Medium Density Fiberboard (MDF) Manufacture;Resin Storage Tanks	24	Pulp & Paper
ptnonipm - 30700997	Industrial Processes;Pulp and Paper and Wood Products;Medium Density Fiberboard (MDF) Manufacture;Miscellaneous Coating Operations	24	Pulp & Paper
ptnonipm - 30700999	Industrial Processes;Pulp and Paper and Wood Products;Medium Density Fiberboard (MDF) Manufacture;Other Not Classified	24	Pulp & Paper
ptnonipm - 30701001	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Direct Wood-fired Rotary Dryer, Unspecified Pines	24	Pulp & Paper
ptnonipm - 30701009	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Rotary Strand Dryer: Direct Wood-fired: Softwood	24	Pulp & Paper
ptnonipm - 30701010	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Rotary Strand Dryer: Direct Wood-fired: Hardwood	24	Pulp & Paper
ptnonipm - 30701015	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Rotary Strand Dryer: Direct Wood-fired: Mixed Softwood/Hardwood	24	Pulp & Paper
ptnonipm - 30701020	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Rotary Strand Dryer: Direct Natural Gas-fired: Hardwood	24	Pulp & Paper
ptnonipm - 30701030	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Rotary Strand Dryer: Indirect-heated: Hardwood	24	Pulp & Paper
ptnonipm - 30701032	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Rotary Strand Dryer: Indirect-heated: Mixed Softwood/Hardwood	24	Pulp & Paper
ptnonipm - 30701039	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Indirect-heated Conveyor Dryer, Softwoods	24	Pulp & Paper
ptnonipm - 30701042	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Conveyor Dryer: Heated Zones: Mixed Hardwood/Softwood	24	Pulp & Paper
ptnonipm - 30701053	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Reconstituted Wood Products Press: Phenol Formaldehyde Resin	24	Pulp & Paper
ptnonipm - 30701055	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Reconstituted Wood Products Press: Methylene Diphenyl Diisocyanate (MDI) Resin	24	Pulp & Paper
ptnonipm - 30701057	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Reconstituted Wood Products Press: Phenol Formaldehyde Resin (surface layers)/ Methylene Diphenyl Diisocyanate (MDI) Resin (core layers)	24	Pulp & Paper
ptnonipm - 30701062	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Sanding Operations	24	Pulp & Paper
ptnonipm - 30701064	Industrial Processes;Pulp and Paper and Wood Products;Oriented Strandboard (OSB) Manufacture;Storage Bins: Trimming and Dryer Exhaust Cyclone Dust	24	Pulp & Paper

afdust - 2805045000	Miscellaneous Area Sources;Agriculture Production - Livestock;Goats Waste Emissions;Not Elsewhere Classified	34	Fugitive Dust-Agricultural dust from livestock
afdust - 2805047100	Miscellaneous Area Sources;Agriculture Production - Livestock;Swine production - deep-pit house operations (unspecified animal age);Confinement	34	Fugitive Dust-Agricultural dust from livestock
afdust - 2805053100	Miscellaneous Area Sources;Agriculture Production - Livestock;Swine production - outdoor operations (unspecified animal age);Confinement	34	Fugitive Dust-Agricultural dust from livestock
afdust - 2801000000	Miscellaneous Area Sources;Agriculture Production - Crops;Agriculture - Crops;Total	35	Fugitive Dust-Agricultural dust from tilling
afdust - 2801000003	Miscellaneous Area Sources;Agriculture Production - Crops;Agriculture - Crops;Tilling	35	Fugitive Dust-Agricultural dust from tilling
nonpt - 2801000003	Miscellaneous Area Sources;Agriculture Production - Crops;Agriculture - Crops;Tilling	35	Fugitive Dust-Agricultural dust from tilling
afdust - 2801000005	Miscellaneous Area Sources;Agriculture Production - Crops;Agriculture - Crops;Harvesting	35	Fugitive Dust-Agricultural dust from tilling
afdust - 2801000008	Miscellaneous Area Sources;Agriculture Production - Crops;Agriculture - Crops;Transport	35	Fugitive Dust-Agricultural dust from tilling
nonpt - 2801600000	Miscellaneous Area Sources;Agriculture Production - Crops;Country Grain Elevators;Total	35	Fugitive Dust-Agricultural dust from tilling

EPA Inventory Sector + SCC	SCC Description	PSAT Tag	PSAT Category
afdust - 2325000000	Industrial Processes;Mining and Quarrying: SIC 10 and SIC 14;All Processes;Total	36	Fugitive Dust-Mining
afdust - 2325020000	Industrial Processes;Mining and Quarrying: SIC 10 and SIC 14;Crushed and Broken Stone;Total	36	Fugitive Dust-Mining
afdust - 2325030000	Industrial Processes;Mining and Quarrying: SIC 10 and SIC 14;Sand and Gravel;Total	36	Fugitive Dust-Mining
afdust - 2325060000	Industrial Processes;Mining and Quarrying: SIC 10 and SIC 14;Lead Ore Mining and Milling;Total	36	Fugitive Dust-Mining
